

PCA_usub

Summer Blanco

2026-08-17

Setup

```
library(tidyverse)
```

```
## — Attaching core tidyverse packages — tidyverse 2.0.0 —
## ✓ dplyr      1.2.1      ✓ readr      2.2.0
## ✓ forcats    1.0.1      ✓ stringr    1.5.1
## ✓ ggplot2    4.0.3      ✓ tibble     3.3.1
## ✓ lubridate  1.9.5      ✓ tidyr      1.3.2
## ✓ purrr      1.0.2
## — Conflicts — tidyverse_conflicts() —
## ✖ dplyr::filter() masks stats::filter()
## ✖ dplyr::lag()     masks stats::lag()
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors
```

```
setwd("/home/FM/sblanco/GWAS_8072026/usub/05_filtering")
```

Read in data

Eigenvec and eigenval files generated from a filtered VCF file using Plink. VCF filters included: QUAL=30; MIN_DEPTH=10; MAX_DEPTH=250; MAF=0.10; MISS=0.75. Filtered VCF had 10,962 SNPs (aligned to uflor ref genome). After pruning, 17,737 of 19,105 variants were removed, leaving 1,368 remaining variants.

```
pca <- read_table("usub_75_pruned.eigenvec", col_names = FALSE)
```

```
##
## — Column specification —
## cols(
##   .default = col_double(),
##   X1 = col_character(),
##   X2 = col_character()
## )
## i Use `spec()` for the full column specifications.
```

```
eigenval <- scan("usub_75_pruned.eigenval")
```

Clean data

Remove nuisance column and set names

```
pca <- pca[,-1]
names(pca)[1] <- "ind"
names(pca)[2:ncol(pca)] <- paste0("PC", 1:(ncol(pca)-1))
```

Assign labels

Species labels

```
spp <- rep(NA, length(pca$ind))
spp[grep("UFL0", pca$ind)] <- "Usnea florida"
spp[grep("USUB", pca$ind)] <- "Usnea subfloridana"
```

Locations labels

```
loc <- rep(NA, length(pca$ind))
loc[grep("11_0", pca$ind)] <- "Russia"
loc[grep("09_", pca$ind)] <- "Latvia"
loc[grep("UFL0_0", pca$ind)] <- "Latvia"
loc[grep("10_0", pca$ind)] <- "Latvia"
loc[grep("08_", pca$ind)] <- "Latvia"
loc[grep("14", pca$ind)] <- "Belarus"
loc[grep("FR", pca$ind)] <- "Austria"
loc[grep("04_0", pca$ind)] <- "Estonia"
loc[grep("05_", pca$ind)] <- "Estonia"
loc[grep("06_", pca$ind)] <- "Estonia"
loc[grep("06_", pca$ind)] <- "Estonia"
loc[grep("FG", pca$ind)] <- "Austria"
```

Remake data.frame

```
pca <- as_tibble(data.frame(pca, spp))
```

Plot variance

Convert to percentage variance explained

```
pve <- data.frame(PC = 1:20, pve = eigenval/sum(eigenval)*100)
```

Plot pve

```
ggplot(pve, aes(PC, pve)) + geom_bar(stat = "identity") + ylab("Percentage variance explained") + theme_light()
```

Calculate the cumulative sum of the percentage variance explained

```
cumsum(pve$pve)
```

```
## [1] 10.00438 17.85697 25.06649 31.25117 36.41888 41.53311 46.45339
## [8] 51.17290 55.80807 60.31945 64.67561 68.95215 73.04070 77.09638
## [15] 81.10640 85.10556 88.98144 92.76087 96.41283 100.00000
```

PC1 & PC2 explain ~17% of the variance observed

Plot PCA

By species

```
ggplot(pca, aes(PC1, PC2, shape = spp, col=spp)) + geom_point(size = 3) + coord_equal()  
+ theme_light() + xlab(paste0("PC1 (", signif(pve$pve[1], 3), "%)")) + xlab(paste0("PC1  
(", signif(pve$pve[1], 3), "%)")) + ylab(paste0("PC2 (", signif(pve$pve[2], 3), "%)"))
```

By location

```
ggplot(pca, aes(PC1, PC2, shape = spp, col=loc)) + geom_point(size = 3) + scale_colour_m  
anual(values = c("#E69F00", "#56B4E9", "#009E73", "#F0E442", "#0072B2")) + coord_equal()  
+ theme_light() + xlab(paste0("PC1 (", signif(pve$pve[1], 3), "%)")) + xlab(paste0("PC1  
(", signif(pve$pve[1], 3), "%)")) + ylab(paste0("PC2 (", signif(pve$pve[2], 3), "%)"))
```

Some slight structure based on region X species?
